PROFESSIONAL SUMMARY

Backend engineer with **5+ years** of experience building **scalable AI-driven SaaS platforms** and handling complex third-party integrations. Key strengths:

- **Third-Party Integrations** – 20+ data sync integrations including HubSpot, Zapier, Salesforce, Google Analytics, Atlassian, etc.
- **Full-Cycle Backend** – Auth systems (SAML/OAuth2/JWT), multi-tenant microservices, event-driven architectures (Kafka, Redis), and DevOps (Docker/K8s).
- **Founding Engineer** – Built Cloudairy's AI-first SaaS backend from scratch, enabling natural language-to-workflow automation.

CORE COMPETENCIES

Agentic AI & AI-Native Development: Claude Code CLI (agents, hooks, skills, plugins), multi-agent orchestration, autonomous pipelines, prompt engineering

AI & LLM: Fine-tuned LLMs (GPT, AWS Bedrock, Claude), prompt-to-flowchart, NLP pipelines, vector databases & RAG (Pinecone)

Backend & Cloud: Node.js, Python, Express, GraphQL, REST, WebSockets, PostgreSQL, MongoDB, Redis, Elasticsearch

Infrastructure: Microservices, Kafka, BullMQ, FluentD, Grafana, Kibana, AWS, Azure, Nginx, Docker, Kubernetes, CI/CD

Payments & Billing: Stripe, DataCap (usage-based billing, invoicing, webhooks)

Integrations: HubSpot, Salesforce, Zapier, Customer.io, Google Analytics etc..

Auth & SSO: Auth0, Okta, SAML2, OAuth2, Google Workspace, Microsoft Entra, OneLogin

Security & Scalability: JWT, RBAC, Multi-tenant isolation, event processing (Kafka, Redis Streams), real-time systems ([Socket.io](#)) and Sentry

WORK EXPERIENCE

Lead Backend Engineer

Cloudairy (AI-Powered Workflow Automation Platform)

January 2024 – Present

Founding engineer building the AI backend for a SaaS platform that converts natural language into workflows and diagrams..

AI-Native Development & Agentic Workflows

- Used Claude Code CLI as primary development tool – agents, hooks, skills, plugins and CLAUDE.md project context to generate, refactor, and debug code, cutting development time significantly.
- Set up CLAUDE.md configurations per project so AI agents had full codebase context for accurate code generation.
- Used Claude for AI-assisted code reviews to catch architecture issues and security problems before human review.

AI/LLM Systems & Automation

- Integrated AWS Bedrock (Claude, Llama) to convert natural language into flowcharts, significantly reducing manual workflow design time.
- Built GPT-4 pipelines with Redis caching to generate multi-step user journeys from plain text prompts with high accuracy.
- Built RAG-based system with Pinecone vector embeddings for AI-powered recommendations for enterprise users.

Enterprise-Grade Backend

- Set up logging infrastructure using Fluentd and Elasticsearch, handling large-scale log processing with real-time anomaly detection.
- Built Redis Queue system for background jobs like PDF generation and AI batch processing.

- Designed multi-tenant auth with JWT claims isolation and SAML SSO (Okta/Auth0) for enterprise clients.

Critical Integrations

- Built Stripe + DataCap billing with prorated subscriptions, webhook retries, and usage analytics.
 - Integrated MS Teams and Slack using OAuth2 and Webhooks so users could trigger workflows from chat commands.
-

Senior Backend Engineer

UZERA(Gainserv) (B2B Customer Intelligence Platform)

November 2022 – March 2024

Scaled data pipelines and analytics for a customer engagement tracking SaaS.

Data Infrastructure & Observability

- Deployed Fluentd + Loki + Grafana stack for centralized logging, which helped reduce incident resolution time.
- Optimized Elasticsearch clusters for behavioral analytics, supporting many segmentation filters with fast query response.
- Built event deduplication pipelines handling high-volume daily events with strong data consistency. Added Redis-backed rate limiting that significantly reduced API abuse while maintaining high uptime.

AI-Enhanced Analytics

- Built LLM-powered survey insights that auto-generate executive summaries from large volumes of survey responses.
- Built anomaly detection system to flag unusual user behavior patterns.

Integration Ecosystem

- Created HubSpot ↔ Salesforce bi-directional sync using Redis-backed idempotency keys, reducing CRM data conflicts.
 - Implemented Zapier webhook translator enabling non-technical users to create automation recipes.
-

Node.js Developer

Dharma Tech

June 2021 – October 2022

Delivered backend solutions for logistics and service-based projects.

- Built REST APIs (Express.js) for fleet management system, improving delivery ETA accuracy.
- Developed real-time dashboard with Socket.io and PostgreSQL to track field service agents.
- Integrated Twilio/SendGrid for automated SMS/email alerts with configurable escalation rules.

Node.js and Python Developer

Rentech Digital

Jan 2021 – June 2021

Built backend systems for client projects across industries.

- Built multi-vendor e-commerce APIs (Node.js + MongoDB) supporting concurrent checkout flows.
- Automated daily financial reports using Python Pandas + CRON, saving significant manual hours weekly.
- Designed JWT-based auth service with RBAC for internal admin portals across multiple client projects.

PERSONAL PROJECT

Autonomous AI Growth Engine (SEO SaaS Platform)

Solo Developer | 2025 – Present

Building an autonomous SEO SaaS platform that handles keyword research, competitor analysis, and content planning pipelines on its own without manual input.

Agentic AI & Autonomous Pipelines / Architecture

- Designed a Turborepo monorepo with 7 pillars and 40 modules. Backend: Express.js + PostgreSQL + Redis (BullMQ) with a 9-stage autonomous pipeline. Frontend: Next.js 14 with App Router, React Query, Tailwind CSS.

- Built entirely using Claude Code CLI with agents, hooks, skills, and CLAUDE.md project context — showing AI-native full-stack development in practice.
- Multi-agent pipeline where each BullMQ worker handles a different stage of SEO analysis (competitor discovery, keyword scoring, content gap analysis) without manual intervention.
- Integrated OpenAI for niche detection, DataForSEO API for market data, and Google Search Console for ranking signals.
- Designed a self-improving rediscovery pipeline that finds new keyword opportunities based on previous analysis cycles.
- Plain JavaScript everywhere (no TypeScript) with raw SQL via pg-promise — optimized for fast AI-assisted development.

EDUCATION

LDRP Institute of Technology & Research, Gujarat Technological University
Bachelor of Engineering - BE, Computer Science

CERTIFICATES

AWS Essential Training for Developers – July 2022
Migrating to AWS – July 2022
